

Q4) Follow up of Q2 (Row-wise)

So the

if $(\text{Half} == \text{rem})$
✓ good.

But if not

$(\text{diff} = \text{Half} - \text{rem})$

Now if $(\text{diff} > 0)$

→ upper half
has more
elements.

Since I can
remove at most
1 element,

So I need to check
if diff exists in top half.

If $\text{diff} < 0$, then I need to check

if $|\text{diff}|$ exists in bottom half.

Q4) Follow up of Q2 (Row-wise)
So the

lets say
you have to
remove from top half.

diff > 0

Condition is that
Component should be
connected.

(Case I)
Let's say if this node
was to be removed, then
of course it is connected from each side.

→ All the
other nodes
can reach
each other
any way

You can only
pick the
leftmost &
Right most
Cell.

Q4) Follow up of Q2 (Col-wise)

So the

Similarly for col,
check if it exists
on the left half.

Again same as the row
edge case we have
the col edge case.

You can pick
only these 2, such
that they
remain
connected.

Q4) Follow up of Q2

Edge case, which I missed and was giving me wrong answer.

Let's say $(n \times 1)$ matrix

$(1 \times m)$ matrix

My prev code would pick array node as the index diff but that could make the component disconnected.
